The Future Use of Gas

The Future Energy panel today at the [Australian British Chamber of Commerce](#) explored the future use of gas which will be required for many decades; decarbonisation of current and future energy sources is key as Australia diversifies its economic base. Australia currently exports more than double its own energy needs. Domestically, gas is needed to firm renewables and keep our manufacturing and industrial sectors competitive. Challenge then is how to decarbonise this critical energy source - technology exists but research is needed to make it as efficient as possible.

Australian British Chamber of Commerce Event: The Future Use of Gas - Julia Soutter (moderator), Eric May, Gary Bryant, Robert Ceic (panel)
